

REBOOT HUB STANDARD | VERSION 1.0

Pre-Owned Drone Grading Standard

A transparent framework for condition labels, assessment evidence, decision rules, and disclosure boundaries used in Reboot Hub listings.

DOI	10.5281/zenodo.21401164	Document	Technical note Version 1.0

Scope: This is a seller-specific disclosure framework for Reboot Hub inventory. It is not an industry-wide certification, a DJI standard, or a substitute for the exact-unit listing.

Quick reference

A+ / Flawless	A / Pristine Pre-Owned
No visible cosmetic marks under the defined inspection conditions. No observed material physical defect. Core functional checks complete without an unresolved warning.	Light wear may be present and shown in the exact-unit listing. No observed crack, chip, structural deformation, or hidden cosmetic restoration is represented as original condition.
Activation, battery, controller, accessories, warranty, and service eligibility are disclosed separately.	Known repair, replacement, or uncertainty about originality is disclosed. Bundle components remain separate disclosures.

Assessment evidence domains

A grade is useful only when it is attached to recorded observations. The following domains define the evidence expected for the exact unit and bundle.

Domain	What is recorded	Boundary
1. Identity and listing match	Model, configuration, internal unit identifier, exact-unit photographs, and bundle contents.	Sensitive identifiers remain internal or redacted.
2. Cosmetic condition	Airframe, arms, landing surfaces, camera housing, gimbal area, fasteners, ports, controller, and accessories under consistent lighting.	Photos must disclose wear that could affect a reasonable buyer's decision.
3. Structure and propulsion	Cracks, chips, deformation, looseness, impact marks, abnormal movement, propellers, and visible safety concerns.	A cosmetic grade cannot override a structural or flight-safety concern.
4. Battery and power	Battery identity and accessible health, cycle, warning, swelling, terminal, charging, or power-on evidence.	Cycle count alone is not proof of health; batteries are disclosed separately.
5. Imaging and gimbal	Camera output, image stability, gimbal startup and movement, lens and sensor-window condition.	Calibration does not conceal binding, deformation, abnormal noise, or warnings.
6. Control, communication, sensors, and software	Controller pairing, startup behavior, exact app or sensor warnings, firmware state, and account-binding observations.	Available checks vary by model, controller, app, firmware, and region.

Evidence rule: Unknown is not the same as passed. When a material fact cannot be verified, the uncertainty must be stated.

Grade criteria

A+ / Flawless

Qualifying evidence	Disqualifying or separate disclosure
No visible cosmetic marks under the defined inspection conditions.	A visible mark, crack, chip, deformation, binding mechanism, exposed cable, or unresolved physical concern.
Core functional checks complete without an unresolved warning.	A repeatable warning, abnormal movement, unstable camera output, pairing issue, or safety concern.
Exact-unit photographs support the stated condition.	Generic photographs, unclear bundle identity, or missing material-angle photographs.
Activation and known history are stated when available.	Activation status is never inferred from appearance; unknown status is disclosed.

A / Pristine Pre-Owned

Qualifying evidence	Disqualifying or separate disclosure
Only light cosmetic wear, visible in the exact-unit listing.	A crack, chip, structural deformation, hidden cosmetic restoration, or wear not represented in the listing.
Core functional checks complete without an unresolved warning.	An unresolved structural, battery, propulsion, gimbal, camera, sensor, controller, or binding concern.
Original or unmodified condition is stated only when available evidence supports it.	Known replacements, repairs, or uncertainty are disclosed rather than hidden behind the grade.
Battery and bundle components have their own condition evidence.	The aircraft grade does not automatically grade the battery, controller, charger, propellers, or accessories.

Decision rules

1. Safety and function precede appearance.

A visually clean unit with an unresolved material concern does not qualify for A+ or A under this document.

2. The exact-unit listing controls.

A generic photograph or grade name cannot replace the unit photographs and disclosures.

3. Unknown is disclosed.

Unverified activation, repair history, liquid exposure, originality, battery status, or service eligibility is not represented as passed.

4. Originality claims require evidence.

Use original or unmodified only when inspection and available history support the statement.

5. Bundle components remain separate.

Aircraft, batteries, controller, charger, propellers, and accessories may have different histories and condition.

6. Warranty and service eligibility remain separate.

The listing and current Reboot Hub policy control warranty. Manufacturer service eligibility is not created by a Reboot Hub grade.

7. Material changes require reassessment.

A return, impact, repair, component swap, battery change, firmware event, or new warning can invalidate an earlier grade.

Minimum assessment record

- Assessment date and reviewer; exact model and configuration; internal serial or unit identifier.
- Exact-unit photographs; cosmetic observations; structural and propulsion observations.
- Battery identity and accessible health evidence; startup, app, sensor, gimbal, camera, and controller observations.
- Known repair, replacement, activation, region, and account-binding information.
- Included accessories, bundle differences, unresolved warnings, unknowns, exclusions, final grade, and assignment reason.

Buyer verification checklist

☐	The photographs show the exact unit offered.
☐	Cosmetic wear is visible and described.
☐	No undisclosed crack, deformation, exposed cable, binding, or warning is present.
☐	The included battery, controller, charger, propellers, and accessories are identified.
☐	Available battery evidence is disclosed without treating cycle count as a guarantee.
☐	Startup, pairing, camera output, and any app warning are recorded.
☐	Known activation, account-binding, region, repair, replacement, and service history is stated.
☐	The listing identifies the applicable warranty and return terms.

Evidence boundaries and limitations

- A non-invasive inspection cannot prove the absence of every latent or intermittent fault.
- A clean exterior cannot prove a unit has never been opened, exposed to liquid, overheated, crashed, or repaired when records are unavailable.
- Battery cycle count, voltage, or app status alone does not guarantee future battery performance.
- Firmware, app menus, service eligibility, account binding, and regional compatibility can change after publication.
- This standard does not authorize flight. The operator remains responsible for legal, environmental, airworthiness, and pre-flight decisions.
- The grade applies only to the recorded assessment state and exact bundle described in the listing.
